SOCIALEAZ

Business Growth Center Audit

From a marketing tool to the place a business sees which effort made it money

Version 1.0 · 9 November 2026

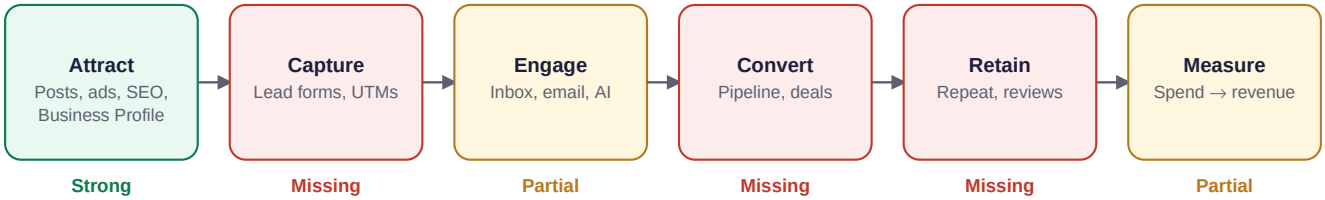
Perspective: CRM product strategy and go-to-market (GTM)

Findings checked against the code; everything marked Proposed is not built yet

1. Executive summary

Verdict. Socialeaz is strong at **creating demand**: post publishing, ad builders for six platforms, email marketing, the Google suite (Analytics, Search Console, Ads, PageSpeed, Business Profile) and the AI Copilot. It does not yet **track who that demand becomes**. Every lead ends somewhere Socialeaz cannot see. Until there is one customer record, Socialeaz stays a marketing tool. A Business Growth Center has to answer one question:

“Which post, ad and conversation made this business money?”



The five moves

- **Build Contact 360**: one record per person, merging inbox chats, email subscribers, lead forms and manual entries. Use phone number as the main merge key, because WhatsApp is the main channel in the Gulf.
- **Capture every lead**: bring Meta and TikTok lead forms back through webhooks, add website forms and WhatsApp click-to-chat links, and store UTMs and ad IDs on each contact.
- **Add a simple pipeline**: deal stages, a value field and one-tap *Mark as won* from the inbox.
- **Let AI do the follow-up**: the Copilot qualifies leads in the DM, scores them, assigns them and nudges them.
- **Show revenue, not just spend**: a Growth Dashboard from *spend* → *leads* → *deals* → *revenue*, with real return on ad spend (ROAS).

Recommended category change: from “social media management” (crowded, priced low) to **“the Growth OS for Gulf SMBs and agencies”**, priced against HubSpot Starter and Zoho rather than Buffer.

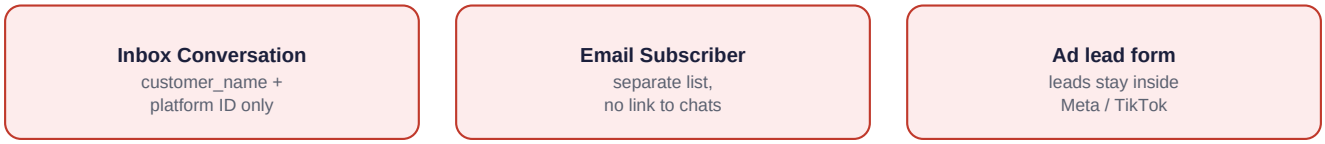
2. Current state — checked against the code

Each finding below was checked in the stagging codebase on 9 November 2026.

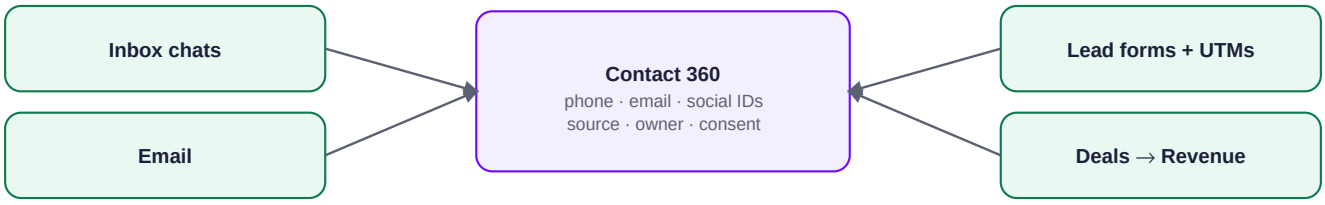
Growth stage	What exists today	Evidence in code	Status
Attract	Publishing to social channels; ad builders for Meta, Google, TikTok, Snapchat, X and LinkedIn; Ads Dashboard with real spend; Google Analytics, Search Console, PageSpeed and Business Profile	Post, AdReport, GoogleProperty models; app/Services/AdServices/*	Strong
Capture	Ad builders can run lead campaigns (Meta OUTCOME_LEADS with Instant Forms), but nothing brings those leads back into Socialeaz. No website forms and no UTM capture	app/Support/Ads/MetaGoals.php has the lead goal; there is no lead webhook and no leads table	Missing
Engage	Unified inbox with AI replies and assignment; email campaigns, lists and segments. The same person on WhatsApp, Instagram and email appears as three strangers	Conversation stores only customer_name + customer_external_id per platform; EmailSubscriber is a separate list with no link to chats	Partial
Convert	No contacts, deals, stages, quotes or tasks	No Contact, Lead, Deal or Pipeline class under app/	Missing
Retain	Replying to Business Profile reviews only. No repeat-purchase, win-back or loyalty flows	—	Missing
Measure	Spend is real and cross-platform. Revenue is unknown, so the dashboard cannot show ROAS, cost per customer or close rate	Ads Dashboard reads spend from platform APIs; no revenue source	Partial

The core problem

TODAY — three separate records, no link to revenue



TARGET — one Contact connects every touchpoint to a deal and its value

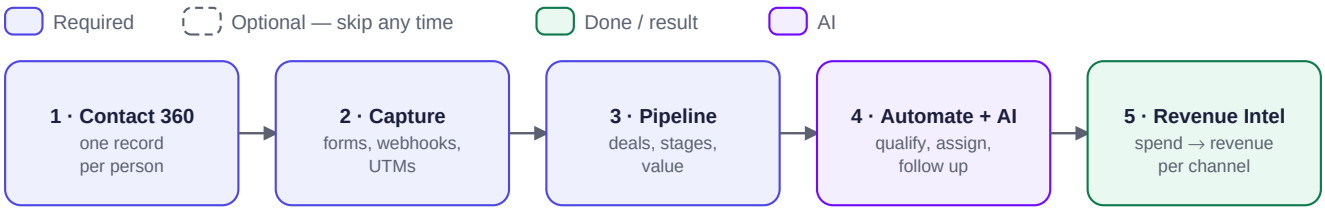


Without a Contact, the inbox, email and ads are isolated features. With a Contact, they become one growth system, and every module adds data to the same customer.

Assets Socialeaz can build on

- **Unified inbox** (Conversation, Message, assignment, AI pause): the natural home for a contact panel.
- **Email marketing** (lists, segments, campaigns, events, SendGrid sub-accounts): ready to send to CRM segments.
- **AI Copilot** (FAQ matching, knowledge-gap reports): can be extended to qualify leads.
- **Ad builders on six platforms plus real spend**: the cost side of ROAS already exists.
- **Team, roles and workspace model**: owner, assignee and agency client scoping are possible.
- **Package entitlements** (config/package_reference.php): new CRM limits can be added as plan features.

3. The Growth Center model — five layers



Layer	What the customer gets	Key features (Proposed)
1 · Contact 360	One profile per real person, across every channel	Automatic merge on exact phone or email match; suggested merges otherwise; timeline of chats, emails, ad clicks and deals; tags, owner, source, consent, lifetime value
2 · Capture	No lead lost, and every lead knows where it came from	Meta and TikTok lead-form webhooks; embeddable website form; WhatsApp click-to-chat link with a tracking code; UTM and ad-ID capture; CSV import
3 · Pipeline	A clear view of who is about to buy	Kanban stages New → Contacted → Qualified → Proposal → Won / Lost; deal value; Mark as won from the inbox; tasks and reminders
4 · Automate + AI	Faster responses without hiring more staff	AI qualification in DMs; lead score; round-robin assignment; no-reply nudges; welcome and win-back sequences through WhatsApp and email
5 · Revenue Intelligence	Proof that Socialeaz makes money	Growth Dashboard: spend → leads → deals → revenue per channel and campaign; ROAS, cost per lead (CPL), close rate, speed to lead; won deals sent back to ad platforms

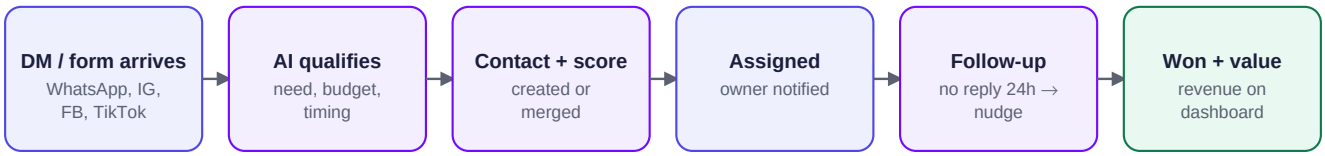
Proposed data model (not built)

Table	Purpose	Key fields
contacts	One person per workspace	workspace_id, name, phone (E.164), email, owner_id, source, utm_*, consent_at, lifetime_value, score
contact_identities	Links a contact to each channel ID	contact_id, platform, external_id; conversations and email_subscribers gain a contact_id
contact_events	The timeline	contact_id, type (message, email_open, ad_lead, deal_won…), ref_id, occurred_at
pipelines / pipeline_stages	Configurable stages per workspace	name, order, probability, is_won, is_lost
deals	An opportunity with money attached	contact_id, stage_id, value, currency, owner_id, source_campaign_id, won_at
tasks	Follow-ups	contact_id, deal_id, assignee_id, due_at, done_at
lead_sources	Webhook and form connections	workspace_id, platform, form_id, field_map

Every table is scoped to a workspace from day one, matching the chosen agency path (full workspace scoping).

4. Key flows

Lead to revenue, with AI



Speed-to-lead rule (default, can be edited)

- New lead from an ad form → contact created → WhatsApp welcome sent within 1 minute (template message) → owner notified.
- No reply after 24 hours → AI nudge; after 72 hours → a task for a person to follow up.
- Qualified by AI (need, budget and timing captured) → deal created in Qualified with an estimated value.
- Mark as won → value added to the Growth Dashboard and the contact's lifetime value; optional review request after 7 days.

Inbox contact panel (where the CRM lives first)

The inbox is the most-used screen. The CRM should first appear there, as a right-hand panel, rather than as a new module customers have to remember to open:

- Header: name, phone, channels this person used, owner, tags.
- Source: "Came from *Ramadan Offer — Instagram lead ad* on 3 Nov".
- Open deal: stage, value, **Mark as won** button.
- Timeline: chats, emails, form submissions, notes.
- AI summary: "Asking about the family package, budget around 2,000 SAR, wants delivery this week."

5. Product and UX changes

Area	Today	Proposed
Navigation	A list of tools (Posts, Ads, Inbox, Email, Google…)	Outcome groups: **Grow** (Posts, Ads, SEO, Google), **Customers** (Contacts, Pipeline, Inbox, Email), **Results** (Growth Dashboard, Reports)
Dashboard first card	Activity and spend	**Revenue this month from Socialeaz**, then leads, cost per lead and top channel
Inbox	Conversations only	Contact panel, deal actions, AI summary
Ads	Spend, clicks, conversions from the platform	Plus leads, deals and revenue per campaign: real ROAS
Agency view	Workspace switching	Client report: leads and revenue per client, white-label PDF
Onboarding checklist	Connect channels, team, AI	Add "Connect a lead source" and "Record your first sale"

6. Go-to-market strategy

Positioning

	Now	Growth Center
Category	Social media management	Growth OS for Gulf SMBs and agencies
Promise	Post, advertise and reply in one place	See which post, ad and chat made you money, in Arabic, on WhatsApp
Competes with	Buffer, Hootsuite, Sprout (priced per channel)	HubSpot Starter, Zoho, Respond.io (priced on value)
Buyer	Social media manager	Owner or marketing lead who owns revenue
Why customers stay	Habit	A revenue number they can't see anywhere else

The wedge

WhatsApp and Instagram DM → lead → sale. This is how most Gulf SMBs actually sell, and global CRMs handle it poorly (English-first, email-first, priced in USD per seat). Socialeaz already has the inbox, the WhatsApp channel and Arabic AI. Adding the contact and the deal completes the loop.

Target segments, in order

- **1. DM-led SMBs**: clinics, salons, real estate, education, restaurants and e-commerce selling over WhatsApp and Instagram. Biggest pain: leads lost in chats.
- **2. Agencies**: need to prove results to clients. The client revenue report becomes their sales tool, and each agency brings in many workspaces.
- **3. Growing companies**: teams with several salespeople who need assignment, pipeline and roles.

Packaging levers (proposal — no live pricing changed)

Plan	Growth Center features	Limit that drives upgrades
Starter	Contacts, inbox contact panel, tags, notes, CSV import	About 1,000 contacts; no pipeline
Pro	Pipeline, lead-form webhooks, website forms, UTMs, Growth Dashboard	About 10,000 contacts; 1 pipeline
Empire	Automations, AI qualification and scoring, multiple pipelines	About 50,000 contacts; automation runs
Unicorn / Agency	Multiple clients, client revenue reports, white-label, Conversions API	Workspaces and contacts

Charge by **contacts and workspaces**, not seats: it grows as the customer's business grows, and SMBs resist paying per seat. New limits fit the existing entitlement system in config/package_reference.php.

Launch messages

- "Stop losing leads in WhatsApp."
- "Know your real cost per customer, not just cost per click."
- Agencies: "Show clients the revenue, not the likes."

7. Roadmap and priorities

#	Build	Why this order	Size
1	Contact model; merge inbox conversations and email subscribers into it	Everything else depends on it	M
2	Inbox contact panel: tags, owner, notes, timeline	Daily value straight away, in the most-used screen	S
3	Meta and TikTok lead webhooks; UTM capture; website form	Stops leaks from ads customers already pay for	M
4	Pipeline and Mark as won with a value	Creates the revenue number	M
5	Growth Dashboard: spend → leads → deals → revenue	The headline for sales, demos and retention	M
6	AI qualification, scoring and follow-up automations	Main difference from competitors; upsell to higher plans	L
7	Conversions API feedback, retention flows, review requests	Results improve over time	L

Milestone: steps 1–5 are enough to change the category and justify a higher Pro price. Step 6 is the main reason to upgrade to Empire.

Success metrics

Metric	What it shows	Target after launch (Proposed)
Workspaces with ≥1 lead source connected	Capture adoption	40% of paying workspaces in 90 days
Workspaces with ≥1 deal marked won	Revenue loop is closed	25% in 90 days
Attributed revenue shown per workspace	Value customers can see	Growing month on month
Median speed to lead	AI and automation impact	Under 5 minutes
Churn: workspaces with revenue shown vs without	Retention effect	Clearly lower churn when revenue is shown
Upgrades caused by contact limits	Packaging works	Track monthly

8. Risks and how to manage them

Risk	Mitigation
Wrong merges (two people combined)	Automatically merge only on an exact phone or email match; suggest other merges; always allow unmerge
Privacy (Saudi PDPL, UAE PDPL)	Store consent and source on every contact; respect unsubscribes across all channels; allow export and deletion
Agency data leaking between clients	Workspace scoping on every CRM table from day one; tests for cross-workspace access
WhatsApp template rules	Use approved templates for the first message outside the 24-hour window; show template status in the UI
Platform APIs not tested live	Ad and Google integrations are only covered by tests that fake the API; test lead webhooks on a real test account before launch
Building a heavy CRM nobody opens	Start inside the inbox and dashboard; no separate CRM module until the panel is used

Decisions needed from you

- Approve Contact 360 (step 1) as the first build.
- Confirm the category change and the packaging direction (contacts and workspaces, not seats).
- Choose the first segment to launch with (recommended: DM-led SMBs).

No application code, data or pricing was changed for this audit.
